Matty's Contribution Statement

I completed the individual Tasks 2 to 4 on my own. I wrote and ran my own Python code to receive and inspect the data, cleanse and transform the data, and perform initial data analysis and visualization-as well as conducting the independent-samples t-test (for Task 4) and the chi-square test (for Task 4). I made all of my own methodological decisions (Yeo-Johnson power transform on Amount, RobustScaler on Time, Z-score outlier detection), interpreted my own results, and wrote up my own understanding of each task under my own name in the shared Google Doc (the same interpretation appears in the Jupyter notebook). I exported the final cleaned dataset to CSV for use in later stages of the project.
